

End of Semester Course Evaluation Report

CPIS-351 IS Analysis & Architecture Design

Second Semester - 2025-2026

Section: DAR

Number of Students: 11

Instructor: Dr. Sahar Jambi

SO Attainment Summary

Student outcome	Students assessed	Students attained	Attainment	Target met
SO2	11	10	91%	Yes

Student pass threshold: 65% of max points; SO attainment target: 65% of assessed students.

Assessment-Based Evaluation

Based on the aggregate SO results, the course met the required attainment target for all assessed outcomes. SO2 achieved an attainment rate of 91%, with 10 out of 11 assessed students meeting the attainment threshold, exceeding the program target of 65%.

The attainment data indicate that students generally demonstrated the expected level of competency in the knowledge and skills assessed under SO2. The strong attainment result may be attributed to high levels of student engagement throughout the semester, combined with the use of diverse and comprehensive assignments and projects that provided opportunities to apply course concepts in meaningful contexts.

Subjective Evaluation

The class consisted of highly motivated and academically strong students, with most students achieving excellent overall performance. This contributed to a productive learning environment in which students were interactive, hardworking, and eager to deepen their understanding of real-world architectural design practices and challenges. Their active participation in discussions and willingness to explore practical applications of course concepts enhanced the overall effectiveness of the teaching and learning experience.

Course Improvement

#	Suggested Improvements
1	Incorporate additional real-world case studies to further strengthen the connection between course concepts and industry practice.
2	Expand hands-on modeling exercises to provide students with more opportunities to apply analysis and architectural design techniques in practical scenarios.
3	Explore and integrate effective AI-supported learning activities that help students enhance their understanding of analysis and architectural design concepts while maintaining critical thinking and independent problem-solving skills.
